## ***Introduction***

An individual or business is most affected by the economic condition in closest proximity to where the individual lives or the business is located. The economic growth of the local economy typically determines the standard of living for the individual and the success of the business.

Local economies throughout the United States many times behave in significant contrast to national or state trends, since national and state data are the aggregation and average of the data for thousands of small economies. Average national growth rates can be much different than local growth rates.

The condition of a local economy can also be much different than neighboring counties, as each has its own characteristics and composition.

This “Historical, Comparative Economic Analysis” examines in great detail the composition, history, and trends of the economy of Pinellas County. By examining the contents of this report, the reader can gain significant insight as to what is driving the economy and how it compares to the rest of the nation. The Analysis is composed of four distinct sections.

***Section 1*** presents the existing composition, impact, and history of thirteen important economic categories. By viewing the charts and graphs provided, you can quickly discern what are the most important factors affecting Pinellas County.

***Section 2*** examines the “Level of the Economy” by studying the growth in the “quality and quantity” of the economy as it influences the economic quality of life for the people living and working in the area.

***Section 3*** compares the growth rate, stability, and economic importance of 118 items over five time periods to the rest of the nation. You will be able to immediately discover short and long-term trends, shifts in the importance of various economic sectors, and discover how stable the economy is. Most importantly, all of the data is statistically measured against the 318 metropolitan areas in the United States so you can quickly see how each item for Pinellas County compares to the rest of the nation.

**Section 4** is provided as a resource. Included is a list of all the metropolitan areas in the United States along with their “Economic Strength” ranking and a printout of the actual economic data for Pinellas County used to create this Analysis.

## ***Study Area***

The geographic definition of the area examined in Pinellas County, Florida. Additionally, in Section 3, data for Hillsborough, Pasco, Hernando, and Manatee Counties in Florida is included for comparative purposes.

## ***Database***

The economic database used to prepare this Analysis is maintained and published by the United States Department of Commerce, Bureau of Economic Analysis, Regional Economic Information System. The Bureau of Economic Analysis is the official economic data-gathering agency for the Federal Government.

This database was chosen for three reasons.

- 1) It is composed of “source data” which has been taken from the administrative records of numerous government agencies as opposed to monthly surveys and polls.
- 2) The data has been collected and analyzed utilizing a reasonably consistent methodology over the entire term of the study period.
- 3) The economic data is historically cumulative relative to the geographic definition of the area.

Due to the time necessary for the various government agencies to collect and collate the economic data, the Bureau of Economic Analysis is unable to publish the results until approximately eighteen months after the end of a calendar year. As an example, many of the elements of the data, such as “proprietors income,” are taken from personal income tax filings. Since final 2001 income tax reports (extended filings) are not due until August of 2002, it is reasonable to understand this data is not immediately available.

The economic history included in this analysis spans the years 1971 through 2000 and was released June 6, 2002. The data for 2001 is scheduled for release in mid-2003.

## ***Data Suppression***

Federal and state laws require employers to report the number of employees and their respective earning for the administration of various government programs such as the Unemployment Compensation program. It is from this reporting most economic data is created. However, the privacy of individual employers is protected. The law provides that if, through a reasonable effort, the actual number of employees or the actual earnings of a private company can be determined from the publication of economic data, then that data must be withheld from the public. The data is suppressed. Throughout this Analysis, especially in Section 1 and Section 3, there will be “gaps” in a data series in a graph, an “na” might appear instead of a number, or a “0” will be in a column. This is the result of data suppression to protect the privacy of a private employer.

## ***About POLICOM Corporation***

POLICOM Corporation is an independent economic research firm, which specializes in analyzing local and state economies. Its products and services evaluate the economic condition of counties, metropolitan areas, and states, determine what is the cause of the condition, and offers suggestions and ideas on how to improve or maintain the economic “quality of life” for the residents.

Some of the company’s services include:

- Presentations and workshops for communities and state and national associations.
- Community Economic Analysis, Goal Setting, and Target Industry Studies.
- Strategic Plan of Action to improve the economy of a local area.
- Customized Economic Reports for communities.

# **Section 1**

## **Components and History**

### **Pinellas County, Florida**

---

## ***Components and History of the Economy***

Every local economy in the nation has its own characteristics. Its rate of growth, composition, consistency, and success will be different from other economies not only within the state but even its next door neighbor.

This Section examines the composition of the Pinellas County economy. Through a review of the history of fourteen economic and industrial categories, the most important elements of the economy can be discovered. Additionally, the twenty-five year history of each of category is graphed so changes, fluctuations, and trends can be visually discovered. Smooth, rising lines in the graphs demonstrate consistent growth while jagged, falling lines demonstrate volatile decline.

The following are the fourteen categories examined in detail in the section:

Employment - Where the jobs are in the economy.

Earnings – What is being earned in total dollars in each industry.

Earnings Per Worker – Which industry pays the most, the least.

Primary Industry Earnings – Which industries contribute to the local economy.

Total Personal Income – Its composition can tell a lot about the local economy.

Construction Earnings - Extremely reactive to the condition of a local economy.

Manufacturing Earnings – The most important contributory industry in most economies.

Transportation & Public Utilities Earnings – This sector has three major components.

Retail Trade Earnings – Discover the spending habits and trends in the local area.

Finance, Insurance, Real Estate – A mixer of wealth in a local economy.

Services Earnings – The fastest growing sector in almost every economy.

Government Transfers – Have significant influence on most local economies.

Per Capita Government Transfers – How dependent is the area on transfers.

Government Earnings – Which level of government is the most dominant.

For each, 2000 data is provided along with the percentage of influence or contribution each has on the local economy and for the total of the United States. The following is an example:

<b><u>Employment</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Retail	23,121	23.6%	27,334,100	16.3%

In 2000, there were 23,121 people employed in Retail in the sample area. These workers comprise 23.6% of all employment in the sample area. Nationally, there are 27,334,1000 full and part-time workers employed in Retail Trade comprising 16.3% of the national employment.

*Technical Note: A “0” appears in data charts in this Section if there was no data reported or if the data was suppressed.*

---

## ***Employment***

Employment includes all full and part-time Wage and Salaried Workers and proprietors. Wage & Salaried workers are those who work for others; a corporation, sole proprietor, or a partnership. Nonfarm Proprietors are typically the small business people in an area. They are unincorporated businesses, sole proprietorships, and the general partners of partnerships.

In most economies, the Services sector accounts for the greatest percentage of the workforce. Areas, which have a significantly larger percentage of Service or Retail workers than the national average, typically are a tourism-based economy, a retirement-based economy, impoverished, or a combination of these.

The **Area %** is the percentage the employment in each industry is of All Workers in the area.

<b>Pinellas</b> <b><u>Employment</u></b>	<b>2000</b>	<b>Area %</b>	<b>USA</b>	<b>USA %</b>
All Workers	573,384		167,465,300	
Wage & Salaried Workers	484,821	84.6%	139,552,000	83.3%
Nonfarm proprietors	88,403	15.4%	25,700,300	15.3%
Services	241,466	42.1%	53,276,700	31.8%
Retail	95,755	16.7%	27,344,100	16.3%
FIRE	56,847	9.9%	13,495,100	8.1%
Manufacturing	50,065	8.7%	19,106,900	11.4%
Local	32,943	5.7%	12,823,000	7.7%
Construction	29,424	5.1%	9,604,300	5.7%

State	4,614	0.8%	4,952,000	3.0%
Military	3,081	0.5%	2,075,000	1.2%
Mining	363	0.1%	795,400	0.5%
Farm	321	0.1%	3,103,000	1.9%

## Pinellas

## Pinellas

---

## **Earnings**

Earnings include all wages and salaries paid to individuals who work for others and the profits of proprietors. It does not include the earnings or profits of corporations located in the area. Data for proprietor profits is principally gleaned from personal income tax filings while wages and salaries are taken from the administrative records filed by the employer with various government agencies.

For Wage & Salaried Workers, earnings principally represent the actual salary or hourly wage payment. For All Workers and all the industries, earnings also include contributions to private retirement programs, fees paid to members of boards of directors, and sometimes other financial benefits.

While Services is typically the largest employer, many times another industry, which pays a higher earnings per worker, will account for the greatest percentage of earnings in an area.

The **Area %** is the percentage the earnings in each industry is of All Workers in the area.

### **Pinellas**

<b><u>Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>

Mining	1,632	0.0%	51,584,000	0.8%

---

## **Earnings Per Worker**

Earnings Per Worker is the estimate of the average annual earnings of the employees in each of the various industries, derived by dividing the total earnings by the total employment in each industry.

Nationally, Federal Civilian employment has the highest annual wage among the industries, which is also many times the case in a local economy. Usually, Services, Retail, and Agricultural Services have the lowest earnings per worker in an area. If Services has earnings per worker greater than the area average, the economy is typically dominated by the Service industry as a result of a high presence of tourism, retirement age individuals, economic distress, or a combination of all of these.

The **Area %** is the percentage each industry's annual wage is of the average for the area.

### **Pinellas**

<b><u>Earnings Per Worker</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>

---

## ***Primary Industry Earnings***

Primary or contributory industries are those which import money to a local economy. This imported money circulates and flows from person to person, business to business, until it is fully consumed and leaves the local economy. The success of most service and retail business and a vast majority of the jobs in a local area are dependent upon this flow. Nationally, the most important primary industry in a majority of the local economies is manufacturing.

However, virtually every industry can serve a contributory function, based upon the type of business activity in that sector. The test of whether a business is contributory to a local economy is determining the source of the money used to pay the wages for the employees of the business. If the source is a result of the sale of goods or services geographically outside the local economy, then the business is primary or contributory. The money for the payroll is imported to the local economy.

As an example, when an automobile is manufactured in one area and sold in another, the money paid for the automobile leaves the buyer's area (consumed) and is sent to the area in which the car was manufactured. The payroll at the manufacturing plant is composed of imported dollars. If a local engineering firm designs a bridge in another state, its fees are imported to the local area and the ensuing wages paid enter the local economy.

Conversely, the local insurance agent, retailer, and even local government are dependent upon the money flowing into an area and are consumptive and reactive in nature.

The size of a local economy will grow in direct proportion to the amount of money entering the area year after year. The reactive-consumptive businesses will grow, or decline, based upon this flow.

POLICOM has developed formulas that attempt to determine the amount of primary or contributory earnings by workers in each industry. The formulas consider certain norms in each industry and are designed to provide a reasonable estimate as to the contributory impact each has on the local economy. These estimates do not consider ancillary spending by a company, such as office supplies, printing, and taxes, but only its payroll.

---

The goal of this exercise is to determine proportions of impact on the local economy, not the exact amount of dollars. The question, “What is the most important industry in the economy?” can be answered.

In many economies, Government Transfers (discussed later in this Section) have grown to such proportion they have become contributory in nature. This simply means there is significantly more money being transferred to the economy than what is being extracted as a result of taxation.

This occurs in areas with a high retirement population (social security and Medicare), regional medical facilities (Medicare and Medicaid), extreme economic distress (Medicaid and Income Maintenance), or a combination of all these. Therefore, in these economies, Government Transfers is a listed primary industry. This is not the case in most economies.

In the following chart, the total amount of primary industry worker earnings is estimated along with the various industrial sectors making the contribution. Government Transfers, if included, are identified as Retirement-Transfers, Medical-Transfers, or Income Maintenance.

The **Area %** denotes the percentage each category is of the total estimate.

**Pinellas****Primary Industry Earnings (000)****2000****% Area**

Total Earnings 7,453,542

Manufacturing	1,559,003	20.9%
Business Services	1,369,264	18.4%

Hotel (Tourism)	14,747	0.2%
Farm	6,538	0.1%

---

## **Total Personal Income**

Total Personal Income (TPI) is defined as the "income received by, or on behalf of, all the residents of the area." There are three distinct ingredients to TPI: 1) Earnings by place of residence, 2) Dividends, Interest, and Rents (passive income), and 3) Government Transfers.

Earned income is the amount of money garnered by an individual through active work during the course of the year. It includes personal wages, salaries, and profits by proprietors. Earned income, for the purpose of calculating Total Personal Income, is derived from earnings by "place of residence" (the county from which individuals file their personal income tax), not "place of work."

All previous data regarding employment and earnings was based upon "place of work," the county where the job is actually located.

Passive income includes money earned from investments, rentals, bank interest, and private retirement plans. It can be stock dividends or simply life insurance benefits. Data for passive income is mainly gathered from personal income tax filings. It cannot be assumed an area's economy benefits from high earnings in this part of the TPI, nor can it be presumed high earnings in this category are a result of the condition of a local economy.

Government transfers are principally payments to individuals residing in the area from the various federal, state, and local government "entitlement" programs. The largest of these programs include 1) social security and disability programs, 2) medical payments (Medicare and Medicaid), 3) income maintenance (welfare), 4) unemployment compensation, and 5) veterans benefits.

From the ratio of the three components of Total Personal Income, certain characteristics of a local economy can be deduced. Typically, areas, which have government transfers greater than 20% of the TPI, have a high retirement population (Social Security & Medicare), a distressed economy (Medicaid and Income Maintenance), or a combination of both.

Areas in which Dividends, Interest, and Rents account for more than 22% of the TPI have a resident population that is affluent (well invested), a high retirement population, or both.

---

Typically, strong economies have greater than 70% of the TPI attributed to earnings and less than 10% for Government Transfers.

In 2000, the San Jose, CA metropolitan area had the highest percentage of TPI attributed to earnings (81%) and is ranked 32<sup>nd</sup> among the 318 metropolitan areas by POLICOM for economic strength. The Punta Gorda, FL metropolitan area had the lowest percentage of TPI attributed to earnings (38%) and is ranked 265<sup>th</sup> for economic strength.

The Boulder-Longmont, CO metropolitan area has the lowest percentage of government transfers (5%) and is ranked 18<sup>th</sup> for economic strength. The Cumberland, MD-WV metropolitan area has the highest percentage of transfers (26%) and is ranked 307<sup>th</sup> for economic strength.

The following is the average percentage for the ten strongest and ten weakest metropolitan area economies (See Section 4 for a list of these areas).

<u>Percentage of TPI</u>	<u>Strongest</u>	<u>Weakest</u>
2000		
Earnings	75%	65%
Dividends	17%	18%
Transfers	8%	17%

Over the last 25 years there has been a dramatic shift in the ratio of the three components. Government Transfers have grown significantly in their influence on local economies. Additionally, as a result of the recent growth in the stock market, Dividends, Interest, and Rents has also grown proportionately. Earnings as a component of the nation's TPI have declined significantly.

The following chart shows the actual Total Personal Income and the percentage of each component for Pinellas County and the United States.

**Pinellas****Total Personal Income (000)**      **2000**      **Area %**      **USA %**

Total Personal Income	28,875,630
-----------------------	------------

Earnings By Residence	16,937,793	58.7%	68.8%
Dividends, Interest, Rents	7,435,115	25.7%	18.3%

Government Transfers	12.9%	12.2%	12.1%	9.8%

**Pinellas**

---

## ***Construction Earnings***

Within the construction industry, there are three basic sub-sectors. Heavy contractors are principally involved in the construction of large projects such as roadways, bridges, office buildings, or factories. General contractors are mainly homebuilders, but also construct small commercial or apartment buildings, and do renovation of existing structures.

Special trade contractors typically are subcontractors for both heavy and general contractors. Known as the “trades,” they do most of the actual work on construction projects. Ranging from earthmovers to plumbers to carpet layers to roofers, special trade contractors usually account for more than half of the earnings in the construction industry. Many special trade contractors are sole proprietors.

The construction industry is extremely “reactive” to the condition of the local economy. In most economies, it is solely dependent upon the growth of other industries, generating the demand for additional housing and commercial establishments, within an area.

When examining the earnings graph for this industry, note upward spikes in the earnings of heavy contractors. This is an indication a major construction project occurred during this time period. The **Area %** denotes the percentage each category is of the total earnings in the construction industry.

### **Pinellas**

<b><u>Construction - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total Earnings	919,658		363,480,000

General Contractors	202,969	22.1%	84,214,000	23.2%
Heavy Contractors	90,802	9.9%	42,293,000	11.6%

## Pinellas

---

## ***Manufacturing Earnings***

The manufacturing sector is divided into two groups, durable and nondurable goods. Durable goods, like their name suggests, are designed to last for a long period of time (minimum of three years). Automobiles, machinery, computers, and washing machines are durable goods. Nondurable goods typically have a short life span and are quickly consumed. Food, plastic cups, paper, and clothing are examples. Wages paid in durable goods are typically much higher than nondurable goods.

Manufacturing is composed of 21 sub-sectors. Since there are so many sub-sectors, data suppression is frequent. Oftentimes in a local economy, one large employer might dominate a particular category. As a result, the data for that category is withheld. While the data is suppressed on the category level, the earnings for the suppressed categories are included in the Total Earnings. The **Area %** denotes the percentage each category is of the total earnings in manufacturing. Due to data suppression, this column might not total 100%.

### **Pinellas**

<b><u>Manufacturing - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total Earnings	2,022,200		958,415,000	
Durable	1,473,192	72.9%	604,160,000	63.0%
Nondurable	549,008	27.1%	354,255,000	37.0%

---

## ***Transportation, Communications & Public Utilities - Earnings***

This sector is composed of three distinct groups: the transportation of goods and people, communications, and privately owned public utilities. Among other things, communications includes local television and radio stations along with local and long distance telephone companies.

The public utilities group includes not only the delivery of utilities such as natural gas, electricity and potable water, but also the production of electricity, such as a nuclear power plant. Data might be suppressed in this group if a major electric manufacturer is present in the local economy. The **Area %** denotes the percentage each group or category is of the total earnings in this sector.

### **Pinellas**

<b><u>Transportation &amp; Pub Util - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>

---

## **Retail Trade Earnings**

Retail Trade is divided into eight sub-sectors. These demonstrate the purchasing trends or habits of the individuals. Typically in strong economies “Eating & Drinking Places” is the most dominant sub-sector, while not all areas which have “Eating & Drinking Places” most dominant have strong economies.

Many tourist-based economies have a high percentage of Eating and Drinking Places.

Many times in weak economies “Food Stores” is the most dominant. “Automotive” and “Building” are very susceptible to the conditions of a local economy. Their growth and decline many times is directly related to changes in the economic condition of the local area. The **Area %** denotes the percentage each category is that of the total earnings in this sector.

### **Pinellas**

<b><u>Retail Trade - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total Earnings	1,882,603		529,301,000

---

## ***Finance, Insurance, and Real Estate (FIRE) Earnings***

This sector tends to mix or churn the money within a local economy. Not nearly as consumptive as Services or Retail, the FIRE serves as catalyst for the movement of money. There are three distinct elements to the sector.

Finance includes depository and non depository financial institutions such as banks, savings and loans, and credit unions. Stock brokerages and holding companies are also included.

Insurance includes both local agencies and carriers. Local insurance agencies grow and decline in direct proportion to the size of the economy. Insurance carriers many times are the companies which the agents represent. Oftentimes an insurance carrier is not dependent upon the local economy as policies, life, auto, health, are written throughout the state or nation. Many times insurance carriers are “primary” in nature.

The Real Estate sector includes real estate developers and real estate brokers. Activity relating to the actual construction of projects, whether land development or home, office construction, is not included in this sector but is included in “construction.”

Typically there are a large number of sole proprietors in the insurance agency and real estate brokerage sector. The **Area %** denotes the percentage each category is that of the total earnings in this sector.

### **Pinellas**

<b><u>FIRE - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total Earnings	1,943,147		576,826,000

Insurance carriers	293,435	15.1%	88,784,000	15.4%
Insurance agents, brokers, and services	166,179	8.6%	50,429,000	8.7%

## Pinellas

## ***Services Earnings***

The fastest growing sector of the national economy, services is the most dominant industry in a vast majority of the economies in the United States

There are sixteen sub-sectors for the Service industry. Since there are so many sub-sectors, data suppression is frequent as one business in an area might dominate so much its employee earnings are withheld.

Typically, Health Services is the most dominant. Areas with an extremely high percentage in Health Services typically have a high percentage of retirement age individuals living in the area. Areas with high percentages of Hotel or Amusements usually are tourism-based economies. If Business Services is high, there is usually a presence of the “high-tech” computer industry (software development or research) in the economy.

The Engineering and Management sub-sector was created in 1988 from Miscellaneous and Business. Data prior to that year is not available. The **Area %** denotes the percentage of earnings the category is of the total earnings in this industry.

### **Pinellas**

<b><u>Services - Earnings (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total Earnings	6,829,596		1,775,526,000	
Business services	2,540,046	37.2%	464,080,000	26.1%

## Pinellas

## Pinellas

## ***Government Transfers***

Government Transfers, also known as “entitlement” programs, have grown enormously in the United States over the last 25 years. In 2000, total government transfers exceeded the earnings of all workers in construction, state and federal government, the military, farming, and agricultural services combined.

Retirement and disability payments typically exceed more than half a local area’s transfers. Medical transfers, principally Medicare and Medicaid (medical assistance for the poor) represent the bulk of medical transfers. Income maintenance includes the nation’s “welfare programs” such as Food Stamps. Some transfers are made to non-profit institutions that administer social programs. On a national basis, more than 95% of all government transfers are made to or on the behalf of individuals.

The impact of the growth of government transfers on the national economy and most local economies has been significant. As transfers grew, so did many industries. The clearest example is Health Services. The graph below shows the growth of earnings in Health Services and the actual number of dollars of Medical Transfers.

In 1987 the Medicare payroll tax was initiated. This provided “new money” for the health care industry and its growth is in direct relationship to that of Medical Transfers.

---

In many areas of the United States, it is not unusual for a hospital to attribute more than 65% of its total revenue to the Medicare and Medicaid programs.

The following graph shows the relationship between earnings in Health Services and Medical Transfers for the study area.

Should the line for Medical Transfers be close to or exceed that of Health Services earnings, then the area is extremely dependent upon Medical Transfers as a source of revenue for the local health care industry.

High percentages of Retirement and Medical payments indicate the presence of a large number of retirement age individuals. High percentages of Medical payments and Income Maintenance indicate impoverishment. The **Area %** denotes the percentage each line is of all government transfers.

#### **Pinellas**

<b><u>Government Transfers (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>
Total transfer payments	4,502,722		1,070,231,000	
Ret. & disab. insurance benefit payments	2,088,805	46.4%	425,333,000	39.7%
Medical payments	1,806,642	40.1%	423,180,000	39.5%
Income maintenance benefit payments	234,633	5.2%	106,421,000	9.9%
Veterans benefit payments	139,344	3.1%	24,939,000	2.3%
Nonprofit institutions	107,455	2.4%	35,133,000	3.3%
Unemployment insurance benefit payments	35,581	0.8%	20,707,000	1.9%

## ***Per Capita Government Transfers***

To better determine the relative impact Government Transfers have on the local area, the per capita amount for each transfer was determined. Medicare and Medicaid are the two largest components of Medical transfers and are listed separately. Food Stamps and Family Assistance are the two best known components of Income Maintenance and are shown separately. Retirement is principally social security payments.

If the “2000 Area” exceeds that of the nation, then the area is receiving a greater % of transfers for the category than the national norm.

### **Pinellas**

#### **Per Capita Government Transfers**

#### **2000 Area**

#### **2000 USA**

Retirement	2,266	1,508
Medical - All	1,960	1,500
Medicare	1,440	765
Medicaid	507	728
Income Maintenance	255	377
Food Stamps	35	53
Family Assistance	27	65

## ***Government – Earnings (000)***

Nationally, government workers account for approximately 15% of all earnings. While virtually all local economies have at least a small presence of Federal and state workers, areas which have a high percentage of either typically benefit economically. Usually state and Federal government pay a higher than average wage and the payroll money is generated from outside the local economy (statewide and national taxation). State and Federal government serves as a contributory industry when the amount of the local payroll exceeds the respective taxation. This occurs in a large degree in state capitals.

Local government typically includes county, city, and school employees along with most regional governments. The **Area %** denotes the percentage each line is of all government earnings.

### **Pinellas**

<b><u>Government - Earnings - (000)</u></b>	<b><u>2000</u></b>	<b><u>Area %</u></b>	<b><u>USA</u></b>	<b><u>USA %</u></b>

Military	81,922	4.1%	75,017,000	7.9%

---

## **Section 2**

**Level of the Economy**

**Pinellas County, Florida**

---

## ***Level of the Economy***

Section 1 statistically and visually identified the elements of the economy relating to each industry's proportion of contribution, growth, and consistency. Section 2 examines the level of the economy as it pertains to growth in "quality and quantity" relating to the people living and working in the area. In this Section, Pinellas County is statistically compared to the state, the nation, and the ten strongest and weakest metropolitan area economies in the United States.

Annually, POLICOM Corporation ranks the 318 defined metropolitan areas for "Economic Strength." After determining the strongest and weakest areas, the characteristics of each are studied. Some of the results of that investigation are included in this Section as the averages for the ten **strongest** and the ten **weakest** economies are used for comparison. More information regarding economic strength and the 2000 rankings for the 318 metropolitan areas are contained in Section 4.

To visually compare the growth of the economy of the area to the rest of the nation, much of the data is "**factored.**" This simply means the data for all the areas is statistically brought to a common denominator for direct comparison. The mathematics is rather simple. First, the annual percentage increase from the previous year is calculated for each year of the study term (the study term in this Section is from 1971 through 2000). Second, the annual percentage increase is multiplied by the same number or factor for each area. It does not matter what number it is, as long as it is the same number for all areas. POLICOM chooses 1000 as the factor beginning. The year 1971 serves as the basis year. All areas begin at 1000 at this point. Where they wind up is determined by their respective percentage increase. This process is similar to the start of a track race. Every runner begins at the same spot. By factoring the data, direct, visual comparisons can be made.

The following are the categories examined in detail in the section:

Annual Earnings Per Worker  
CPI Adjusted Annual Earnings Per Worker  
% of Gain of the AEPW  
CPI Factored AEPW  
Factored Comparisons – Population, Earnings, Employment  
Population – Factored Comparisons  
Earnings – CPI Factored  
Employment – Factored  
Per Capita Personal Income – CPI Factored  
Government Transfers

## ***Annual Earnings Per Worker (AEPW)***

One of the best means to measure the “quality” of a local economy is to examine the growth in the Annual Earnings Per Worker (AEPW). The annual earnings by people in an area, and respective growth, establishes the level of their “standard of living.” How much money they earn each year determines the quality of their housing, the food they eat, the amount of taxes they can pay, and the size of their savings or retirement account.

Earl Nightingale, the famous writer and philosopher, was fond of saying, “there is nothing more important than money... for those things for which money is intended.”

Since the amount of money people are paid each year, for the vast majority of the people, determines their lifestyle, the annual earnings per worker will be examined thoroughly for the area.

The following graph shows the actual AEPW for Pinellas County, the state, and the nation from 1971 to 2000.

## **CPI Adjusted Annual Earnings Per Worker**

The previous graph showed the actual AEPW for the area. While the growth trend could be visualized, it is difficult from that graph to identify relative improvement in the AEPW. Due to inflation over the years, the value of the earnings in 2000 is different from the value in previous years. If an area gained 3% in one year while inflation was 5%, the value of the AEPW, or quality of the growth, actually declined.

To determine if the quality of the economy has grown, the AEPW needs to be adjusted for inflation. Using published inflation information provided by the Bureau of Economic Analysis, the AEPW for each year was brought to the value of the 2000-dollar. By adjusting for inflation, we can determine if the quality of the economy has actually improved over the course of time. The graph below shows the actual AEPW along with the CPI Adjusted AEPW. Every economy dipped during the high inflationary period in the late 70's and early 80's.

The adjusted line shows the "real" growth in the quality of the economy relative to inflation. Note if the area is higher than the 1971 level. Many economies in the country are not. Also note the line pattern for the last ten years. Is it declining, flat, or increasing? This represents the trend for the quality of the economic growth for the area.

---

## **% The Area AEPW Is Of ...**

Having now determined if the quality of the economy has grown, stayed the same, or declined, based upon the CPI-AEPW, it is important to discover if this pattern is unusual, good, or bad relative to rest of the nation. Has the quality of the growth in Pinellas County gained or lost ground relative to the state or the nation?

Since the cost of living varies among areas in the country, comparing the actual AEPW is not statistically valid. An individual earning \$30,000 per year in a rural county in Kansas has much more purchasing power than an individual earning the same amount of money living in New York City. Therefore, other methods are used to make comparisons.

The first method of comparison is to calculate the percentage the Pinellas County unadjusted AEPW is of the state and the USA. For each year, the AEPW was divided by the AEPW for the state and the nation. As an example, if the area's AEPW for 2000 was \$25,000 and the state's AEPW was \$26,000, the percentage the area's AEPW of the state's AEPW would be 96%.

By doing this calculation for all of the years, a pattern or trend can be determined. The question is: "Has the quality of the economy gained or lost versus the state or nation.

If, in one year, the area's AEPW was 90% of the state's AEPW, and the next year it was 92%, the area gained against the state. However, if the following year the area's AEPW was 88% of the state, then it did not improve as much as the state.

The first graph on the following page shows the percentage the Pinellas County AEPW is of the state and the USA for each year. The second graph shows the percentage the AEPW is of the USA along with the average of the strongest 10 economies and the weakest 10 economies. Each time the line goes up, the area gained, when it goes down, it lost.

Note how the strongest economies have steadily gained against the nation for the last ten years while the weakest areas have been declining relative to the AEPW for the USA for the last 30 years.

### Pinellas

### % of USA AEPW

---

## **CPI Factored AEPW**

Finding the percentage the area's AEPW is of the state and the nation is one method to determine the relative growth or decline of the quality of the economy. A second method is to review the CPI Factored AEPW. (See "Factored Data" in the beginning of this Section for an explanation of this concept.)

By factoring the inflation adjusted AEPW for each area, we can directly compare the growth of the quality of each economy.

Beginning at the same starting point in 1971 (1000), the CPI Factored AEPW demonstrates the level of the quality of the economy to 2000. Remember communities suffered a decline in quality during the high inflationary period in the late 70's and 80's.

The first graph compares Pinellas County to the state and the USA and the second graph compares it to the strongest and weakest ten economies in the nation.

Note how the strongest areas have a level significantly higher in 2000 than in 1971 and the weakest significantly lower.

## ***Factored Comparisons – Population, Earnings, Employment***

The previous graphs measured and compared the “quality” of the economic growth for Pinellas County. The following discuss the “quantity” of the economic growth. Quantity is the size of the economy. Quantity is reflected in the growth of total earnings, total employment and the relationship to the growth of the population.

The growth rates for population, CPI adjusted earnings, and employment have been factored for the following graphs for direct comparison. Three important characteristics should be noted when studying the following graphs. In strong economies, 1) both lines for earnings and employment will be increasing, 2) the rate of growth of population should be slower than the growth of both earnings and employment and 3) the rate of growth for earnings should be “pulling away” from the growth line for employment.

For the strongest economies on the next page, note the line for earnings is growing at a greater rate than the line for employment for the last ten years. Remember that on the previous page the CPI Factored AEPW also went up during this period. When employment growth exceeds earnings growth, the CPI Factored AEPW will decline.

### Strongest

### Weakest

---

## ***Population***

It is a characteristic of strong economies to grow in population, but not all areas, which have grown significantly in population, have strong economies. Of the 50 strongest metropolitan areas, only twenty are among the 50 fastest growing areas in population over the last ten years. Eleven of the 50 fastest growing metropolitan areas rank in the lower 1/3 in economic strength. In fact, the Yuma, AZ metropolitan area, ranked 314<sup>th</sup> among the 318 areas for economic strength, had the 3<sup>rd</sup> fastest population growth rate for the last ten years.

Overall, it is a characteristic of weak economies to have extremely slow population growth or actual population decline. Among the 25 weakest metropolitan areas, 18 had a population growth rate slower than 2/3rds of the metropolitan areas, six lost population, and only five grew in population faster than the national average.

Growth in population, however, is a natural occurrence in strong economies. As a result of quality employment opportunities, fewer young people leave the area to seek a career, choosing to remain “at home” to start their families. Additionally, there is in-migration of others to the strong areas, typically from weak economies, because of the economic opportunities.

The reverse is the case for weak economies. Residents many times have to move from their homes to other areas to find basic employment. For highly educated and skilled individuals, they leave as quality “career” jobs many times to not exist in the weak areas.

An area will grow in population for three reasons: 1) a strong economy, 2) in-migration of non-working individuals (typically retirees), and 3) immigration from a foreign country (prevalent along the border with Mexico.)

---

## ***CPI Factored Earnings***

One of the two best ways to measure the growth in the quantity of the economy is to examine the total Earnings in the area. Earnings is the volume of money being moved throughout the economy via the various industries through wages and the earnings of small business proprietors. Please see Section 1 for the meaning of Earnings.

The relative growth of Earnings demonstrates the increase in the quantity of the economy. Total Earnings have been adjusted for inflation just like the AEPW to create the CPI Adjusted Earnings. The CPI Adjusted Earnings were then factored.

On the following graphs, the CPI Factored Earnings are compared to the state and nation and to the strongest and weakest economies.

Note how the strongest economies have had smooth, consistent growth in the quantity of their Earnings while the weakest areas have basically had no relative growth for the last fifteen years.

---

## ***Employment - Factored***

A second, corresponding way to measure the growth in the size of the economy is to examine the total Employment in the area. Employment is the number of people moving the money throughout the economy via the various industries. Please see Section 1 for the meaning of Employment.

As with Earnings, the growth of Employment demonstrates the increase in the quantity of the economy. Total Employment is not affected by inflation and has not been adjusted for changes in CPI. The growth rate for employment has been factored for comparison.

On the following graphs, the Factored Employment is compared to the state and nation and to the strongest and weakest economies.

Note how the strongest economies have had a smooth consistent growth in the quantity of their employment. The weakest areas have had some increase in the number of jobs over the last fifteen years, but the increase is extremely low.

### Employment Factored

### Employment Factored

---

## ***Per Capita Personal Income – CPI Factored***

Per Capital Personal Income (PCPI) is the Total Personal Income for the area divided by the resident population (mid-year population estimate). Please see Section 1 for an explanation of Total Personal Income (TPI).

Growth in PCPI has been a traditional method of measuring the growth in the quality of an economy but should be used with trepidation. Due to the methods used to calculate both TPI and PCPI, the results can be very misleading regarding the condition of the local economy.

As stated in Section 1, TPI has three components: 1) earnings by place of residence, 2) passive income, and 3) government transfers.

Data for the first two is collected from personal income tax. When an individual files personal income tax, the individual identifies a county of residence. It is to this county the individual's earnings and passive income is credited. Some states have tax policies which encourage out of state individuals to own a second home in the state, claim the state as their legal residence, and file their income tax from that state, even though the income was actually earned in another state. This practice increases the TPI for county and state of declared residence while the income has nothing to do with the local economy.

Additionally, distressed areas typically grow in the amount of Government Transfers related to aiding the poor, such as Medicaid and income maintenance payments. Once again, the TPI increased, but only because the economy is weak, not strong.

Another distortion can occur due to population anomalies. The presence of a prison or a large university in the area can increase the population count, diluting the PCPI.

The PCPI has been adjusted for inflation and factored. On the following graphs, note the line for the strongest areas is similar to the growth line for CPI Factored AEPW. However, for the weakest areas, the line has gone up, while their CPI Factored AEPW went down. This phenomenon can be explained by examining Government Transfers.

### CPI Factored PCPI

### CPI Factored PCPI

---

## ***Government Transfers***

From the previous graphs for CPI Factored PCPI, it was discovered the weakest economies grew in this category while declining in CPI Factored AEPW. This can be attributed to the growth of Government Transfers. Please see Section 1 for an explanation of Government Transfers.

The percentage Government Transfers are of the Total Personal Income not only is an indication of the strength of a local economy, but also can be one of the causes of the condition of the economy. When Government Transfers are spent, the money typically enters the economy in either the Services or Retail sectors. Services and Retail are typically two of the lowest paying employment sectors in a local economy. Areas with a high percentage of Government Transfers have a much greater proportion of the workforce employed in the lowest paying sectors of the economy than areas with a lower percentage of Government Transfers.

Areas with a high percentage of Government Transfers have 1) a large portion of the population over the age of 65, 2) high economic distress, or 3) a combination of both.

It was noted in Section 1 – Total Personal Income, that it is a characteristic of strong economies to have a relatively low percentage of Government Transfers as a component of TPI and a high percentage attributed to Earnings. The opposite is true for weak economies.

The first of graphs show the annual percentage Government Transfers are of TPI. Note how in the weakest areas this percentage has grown significantly since 1971.

The pie graphs, which follow, demonstrate the shift from 1971 to 2000 in the composition of TPI. Note how the strong economies have maintained a large percentage of TPI attributed to earnings by residence and a small percentage of Government Transfers, while the reverse is true for the weak areas.

## ***Comparative Analysis - Introduction***

The author Robert Burns wrote, "Oh would some power the Giftie give us to see ourselves as others see us." Having proper perspective is very important. This is one of the features of the "Comparative Analysis" section of this report.

The comparison method has been chosen since the importance and relevance of economic growth percentages has always been somewhat subjective.

As an example, an area might have a 2% increase in employment for a given year and the local newspaper reports this fact. One reader might interpret the 2% figure as "great." Since employment went up, things must be good. Another reader however looks at the 2% as a modest gain and feels the local economy needs a "jump start." With the 2% number just dangling, community leaders have no alternative but to give subjective opinions to its relevance.

By comparing the growth rate to the rest of the nation in a uniform and consistent manner, the numbers gain much more meaning. If it is discovered the 2% rate happened to be either the highest or the lowest in the nation, community leaders have a much better perspective of the condition of their local economy.

Not only is it important to study the growth rate of the economic elements of an area, but it is equally important to examine how and in what manner the growth occurred. Some areas grow, or decline, in a consistent manner. Others have boom, bust cycles. The stability of the growth is a reflection of the character of the economy.

In this section, the growth rate, the stability, and the economic importance of 118 items are calculated and compared to the rest of the nation. From this information, the reader can determine the most or least important elements of the economy and discover if they are growing or declining relative to the rest of the nation.

## ***Guide To Understanding the Data***

Calculations for each of the 118 items are made for growth rate (AAI), stability (DF), average during the term (AVG), and the percentage of impact the item has upon the economy (%). Each of these is calculated for five time periods and the area is ranked for comparative purposes.

---

## **Time Periods**

The data period for this Section is the 21 years from 1980 to 2000. Calculations are made for each of the 118 items for five periods of time. These are noted in the first column heading for each section of data. They include:

**2000-1996** – 5-Year Term: Represents the average for the most recent five years for which source data is available.

**2000-1991** – 10-Year Term: Represents the average for the most recent ten years for which source data is available.

To determine recent trends, compare the 5-Year Term to the 10-Year Term. If the rate of growth is greater during the last five years of the ten-year period, you can see the trend is upward. However, if the average during the last five years is lower than the ten-year period, the trend is downward as the first five years of the ten-year period had a greater growth rate.

**1990-1981** – Previous 10-Year Term (P10): Represents the average for the earliest ten years of the 20 years of data examined.

**2000**: Represents the actual data for 2000, the last year for which source data is available.

**1980**: Represents the actual data for 1980. 1980 was used as the first base year for calculating the 20 year study period.

To compare the Pinellas County economy in the “present – past” sense, examine the differences among the difference time periods. To discover significant shifts, look at the differences in “%” between 2000 and 1980.

At the top of each column of the ensuing data charts for the 118 items are eight column headers. The following is an explanation of their meaning.

2000-1996	<u>AAI-5</u>	<u>Rank</u>	<u>DF-5</u>	<u>Rank</u>	<u>Avg 5</u>	<u>Rank</u>	<u>% -5</u>	<u>Rank</u>
-----------	--------------	-------------	-------------	-------------	--------------	-------------	-------------	-------------

### ***AAI – Economic Growth***

Economic Growth is the rate of increase or decrease of the item. Growth rates are shown as a percentage of increase. The mathematics for this calculation is rather simple. For each year of the study period (2000-1980), the increase from the previous year is calculated and shown as a percentage.

---

As an example, if an area had 7,800 proprietors in 1980 and 8,000 proprietors in 1981, the area would have a 3.84% increase from the previous year in the Number of Proprietors ( $8,000 - 7,800 / 7,800 = .0384$ ). If in 1982 the area declined to 7,900 proprietors, it would have a 1.25% decrease from previous year ( $7,900 - 8,000 / 8,000 = -.0125$ ). This process was repeated for each of the 20 years. (1980 data is used to calculate the change for 1981.)

For each of the three time periods included in this section, the Average Annual Increase (AAI) for those time periods was calculated by totaling the annual percentage growth rates for the respective years and dividing by the appropriate number of years. As an example, if an area, over the 5-Year Term had growth percentages of 4.10%, 3.79%, 2.65%, 5.76%, and 3.24%, the AAI-5 is 3.91%. The # next to the “AAI” is the time period for the data.

## ***DF – Economic Stability***

Areas grow and decline economically in different manners and at different rates. Local economies are subject to rapid shifts. Due to changes in the strength of the primary industries which support the area, local economies can rise and fall, boom and bust, from year to year. Simply identifying the areas that have highest or lowest growth rates is insufficient. The rate, consistency, or stability of the growth is equally important.

Areas with unstable, boom and bust economies are difficult places to conduct business. Residents of the area are subject to economic uncertainty and stress. A merchant may lease extra floor space following three or four great years, only to go bankrupt after a subsequent economic decline. Residents might make long term financial commitments based upon rapid increases in earnings and employment growth, only to lose everything due to a sudden downturn causing massive layoffs.

Since the concept of measuring the consistency or stability of economic growth is so important, it is appropriate to examine this measurement in greater detail so the information provided for the 118 items can be thoroughly understood.

To better understand the nature of economic stability we will examine the consistency of the annual growth of an industry for three area economies.

The first graph shown depicts a Mythical Area, which had an Average Annual Increase in Construction Employment of 4.1% from 1987 through 1996.

This Area had a 4.1% increase from 1986 to 1987.

From 1987 to 1988 it again had a 4.1% increase.

Each and every year, the area had exactly a 4.1% increase. This means construction employers, each and every year, increased the number of people they employed by 4.1%.

As a result, by averaging the 10-year history the Mythical Area, obviously, had a 4.1% AAI-10.

Most importantly, the area had perfect stability as depicted by the straight horizontal line on the graph. The flow of money into the area, which supports this industry, grew in an absolutely consistent manner. This is a perfect situation. However, this is myth, not reality.

Reality is different. The rate of the money entering a community fluctuates. In some communities the fluctuation is not severe. In others, it can be quite disruptive.

Let us examine the economic stability of the Akron, Ohio metropolitan area for the same economic element. Akron, during same ten years had an AAI-10 in Construction Employment of 4.1%. As represented in the graph, you can see the rate of growth is not absolutely stable. While over the 10 years it averages 4.1%, there are obvious fluctuations year by year. From 1986 to 1987, there was a 7.3% increase. The next year a 6.4% increase. The next year a 2.7% increase, so on and so forth.

For the 10 years, the average of the annual increases is 4.1%. However, the rate of growth is not nearly as stable as the Mythical Area. The growth line is not straight but goes up and down.

While the rate of growth of Construction Employment for Akron is not absolutely stable, it is considerably more stable than the Bismarck, North Dakota metropolitan area. As with Akron and the Mythical Area, Bismarck had an average annual increase (AAI-10) of 4.1% over the 10 years. As you can see in the graph, the rate of growth is extremely volatile.

From 1986 to 1987, Bismarck lost 2.4% of its construction workers, the next year it lost 8%, then it increased construction employment 4.2%, then 17%. Once again, the average for the 10 years is 4.1%, but the type and quality of growth in this industry is considerably different than that of Akron.

Obviously, simply relying upon economic growth percentages is not sufficient in order to determine the character of a local economy. Economic stability must be considered.

To measure economic stability, the difference or deviation in each successive year's percentage of growth is calculated (absolute number) and averaged, creating the average deviation from the previous year. This average is then subtracted from the AAI for the same time period to provide the **Deviation Factor (DF)**. The Deviation Factor is the difference between how fast the area grew and how stable the growth.

The greater the number, the more rapid-consistent the growth. If the number is negative, then the deviation or instability was greater than the actual growth.

As an example, Akron had an increase in Construction Employment in 1987 of 7.3% and in 1988, 6.4%. The deviation was .9 of a percentage point ( $7.3\% - 6.4\% = .9\%$ ). In 1989, the growth was 2.7%. Therefore, the deviation is 3.7 percentage points ( $6.4\% - 2.7\% = 3.7\%$ ). The electronic spreadsheet formula is "Absolute (A-B)." The deviation is calculated for each year and averaged, creating the average deviation from previous year.

---

For Akron Construction Employment, this average was 2.77%. This means that each year the growth rate changed on an average of 2.77% percentage points from the previous year. This number is subtracted from the AAI (4.1%) yielding a Deviation Factor of 1.33%. Bismarck's average deviation was 8.58%, thusly, yielding a DF of -4.48%. The Deviation Factor demonstrates how consistent the growth has been over the respective term.

## ***AVG – Average for the Term***

For each of the three time periods, the Average of the actual data for the item is provided. As an example, for “Construction – Earnings” the AVG would be the amount of actual earnings by those employed in Construction over the time period. If over the 5-Year Term, the earnings for the individual years were \$500,000,000, \$550,000,000, \$600,000,000, \$650,000,000, and \$700,000,000 respectively, the average over the term would be \$600,000,000.

For 2000 and 1980, the actual earnings for each year is included under AVG.

## ***% - Percentage of Importance***

For each of the five time periods, the percentage (%) the item is of the area economy is presented. This represents the weight or importance the item is in the economy. By studying these percentages, you can determine which of the 118 items have the greatest or least impact upon your economy. One item might have extremely high growth rates within the economy, but its percentage of the economy might be so low that it is insignificant.

The percentage (%) is calculated by taking the **AVG** data for a time period and dividing it by the total for the area of the respective general category.

As an example, if “Construction – Earnings” averaged \$600,000,000 for the 5-Year Term and the average of the “Earnings – All Workers” for the area was \$7,500,000,000, then the earnings by those employed in Construction represents 8% of all the earnings in the area, on average, for the five years.

For the years 2000 and 1980, once again actual data is used and the percentage is for each respective year. There is a footnote under each page explaining what the percentage represents for each item.

---

## **Rank**

For each calculation, following **AAI, DF, AVG, and %**, there is a **Rank**. Rank is the direct comparison of each element to the 318 defined metropolitan areas in the United States. The Rank provides the relative position each element is to the rest of the nation.

From the Rank, you can determine if the growth for Pinellas County is high or low, the stability good or bad, the relative size of the economy (AVG), and how the composition of the economy (%) compares to other economies in the United States.

The Office of Management and Budget (OMB) defines metropolitan areas based upon the size of the economy and the geographic commuting patterns in an area. A metropolitan area cannot be less than one county, is oftentimes more than one county, and can span state lines. The most important determining factor in establishing the geographic boundaries for metropolitan areas are commuting patterns. The OMB attempts to determine areas where individuals both work and reside. It is the goal to establish “contained” economies where money is both earned (work) and spent (reside).

To determine the Rank, data for each of the 318 metropolitan areas was extracted. Calculations for each element for each item were made. Each element was in-turn ranked for its value against the other 317 metropolitan areas, providing a relative position to each element.

Each element for Pinellas County was placed into the metropolitan area matrix to determine its Rank, relative to the 318 metropolitan areas in the nation. A rank of 1 is the highest and 318 the lowest. If Pinellas County has a rank of 319, then it is lower than any of the 318 metropolitan areas.

State data is compared and ranked to the other 49 states.

**To provide additional comparisons, data for Hillsborough, Pasco, Hernando, and Manatee Counties in Florida was also processed and ranked.**

## ***Additional Comparisons***

In addition to the Rank, Pinellas County can be compared to the nation as a whole and the metropolitan areas. For each item, calculations are presented for the following:

---

**USA:** Includes the data for the United States as a whole.

**USA MET:** Includes the total of all the data for the metropolitan portion of the nation. This includes approximately 80 percent of the population of the nation.

**USA NON-MET:** The total data for the non-metropolitan portion of the nation. This represents the “rural” areas of the country and composes approximately 20% of the population.

**MET HIGH:** This is the highest number for each element among the 318 metropolitan areas. For the AAI, it is the fastest growth rate. For the DF, it is the fastest most stable growth. For AVG, it is the largest. For the %, it is the highest.

**MET LOW:** The opposite of MET HIGH, it is the lowest number for each of the 318 metropolitan areas for each element.

### ***Let's Walk Through One***

To facilitate your understanding of the comparative data, the following is a step-by-step walk through for a hypothetical sample section, which appears below. The data in the sample is mythical.

#### ***Employment - Construction***

2000-1996	Example Not Current Data	AAI-5						
		Rank	DF-5	Rank	Avg 5	Rank	% -5	Rank
USA	4.64%		3.60%		8,069,980		5.28%	
USA MET	4.74%		3.66%		6,564,941		5.22%	
USA NON MET	4.25%		3.37%		1,505,039		5.55%	
MET HIGH	12.73%		7.48%		212,967		12.68%	
MET LOW	-5.83%		-14.62%		1,504		2.28%	
Sample State	3.87%	34	1.80%	23	450,173	3	5.75%	22
Sample Area	4.96%	131	3.36%	30	65,539	25	5.26%	181

**2000-1996** – the 5-Year Term: the last five years for which source data is available.

**AAI-5** - Over this time period, employment in the construction industry grew nationally (**USA**) at the average annual rate of 4.64%. The metropolitan portion of the country (**USA MET**) grew at the rate of 4.74%. The non-metropolitan portion of the nation (**USA NON-MET**), mostly the rural areas, grew at the rate of 4.25%.

The fastest growth rate for the 318 metropolitan areas (**MET HIGH**) was 12.73% while the slowest rate of growth (**MET LOW**) was an average loss of 5.83% of construction employment per year.

---

The State in which the sample area is located had an average annual increase of 3.87%. This was the 34<sup>th</sup> fastest growth among the 50 states. The sample area grew annually 4.96%, which was the 131<sup>st</sup> fastest growth rate among the 318 metropolitan areas.

**DF-5** –On average, the annual Deviation Factor, growth vs. stability, over the five-year period was 3.60% nationwide (national and state data will not fluctuate as much as local areas). Among the 318 metropolitan areas, the best growth-stability ratio was 7.48% while the worst was -14.62%.

The State's DF was 1.80%, which ranked 23<sup>rd</sup> among the 50 states. The sample growth-stability factor was 3.36%, which ranked 30<sup>th</sup> among the metropolitan areas.

**AVG & %** – During the 5-Year Term, there was an average of 8,069,980 individuals employed in the Construction industry in the United States, representing 5.28% of the workforce. Of those, 6,564,941 were employed in the metropolitan portion of the country (5.22% of the workforce) and 1,505,039 were in the non-metropolitan portion (5.55% of the workforce).

The highest number of construction workers of any metropolitan area was 212,967 and the fewest was 1,504. The highest percentage of the workforce employed in construction among the metropolitan areas was 12.68% with 2.28% being the lowest.

Within the State, there was an average of 450,173 employed in construction, the 3<sup>rd</sup> highest number among the 50 states. Construction composed 5.75% of the workforce, which was the 22<sup>nd</sup> highest among the 50 states.

For the sample area, on average, 65,539 were employed in construction, the 25<sup>th</sup> largest number among the 318 metropolitan areas. Construction employment composed an average of 5.26% of the sample area workforce, being the 181<sup>st</sup> highest percentage among the 318 metropolitan areas.

## ***Terms To Understand***

The following is an explanation of several of the terms used in this section.

**EARNINGS:** With the exception of "Wage & Salaried Workers – Earnings," this includes all wages & salaries paid to workers, the earnings of proprietors, and "Other Labor Income." Generally, "Other Labor Income" includes the employer and proprietor contributions to private retirement programs. For

---

earnings under “Wage & Salaried Workers – Earnings,” earnings do not include “Other Labor Income” but reflects just wages and salaries paid to individuals who work for others. Earnings are in \$000.

**EMPLOYMENT:** Includes all full and part-time wage and salaried workers and full and part-time proprietors. Under “Nonfarm Proprietors – Employment,” it reflects the number of proprietors.

**AEPW:** Denotes the “Annual Earnings Per Worker” for category. This is derived by dividing the total earnings in each industry by the total employment in each industry.

**PROPRIETORS:** An unincorporated business or partnership. Typically the “small businesses” in an area, a proprietor can be full or part-time. Proprietor earnings are typically derived from Federal Income Tax filings.

## ***Items Analyzed***

The following is the list of the 118 items, which are included in this Section along with their corresponding page number.

For some items, an “na” or “0” might appear for one or more time periods or for the entire data item for Pinellas County. This means the data has been suppressed to prevent disclosure or there was too little data to be included in the area totals.

Also, in the Agricultural Services, Mining, and Farm, do to data suppression and extreme volatility, there will be extreme numbers in the percentages.

### *Resource Information*

#### **Metropolitan Areas Economic Strength Ranking**

**Economic Data: Pinellas County, FL**

---

## ***Metropolitan Areas***

The United States is composed of 318 defined metropolitan areas. These metropolitan areas comprise approximately 80% of the nation's population and principally represent the non-rural portion of the country.

The Office of Management and Budget defines metropolitan areas. Geographically a metropolitan area cannot be less than one county (or equivalent political subdivision) and most often is composed of multiple counties. Metropolitan areas can also span states lines, including counties from two or more states.

The most important criteria for establishing the geographic definition of a metropolitan area is to determine a "contained" economy. It is the goal in establishing metropolitan areas to create an area where a preponderance of the people live and work, earn and spend. It is an area where economic activity is principally contained in a definable geographic area.

This is accomplished by reviewing the commuting trends among counties. One county might serve as the source of employment with people living in bordering counties driving from one county to another. All of the counties involved are included in the metropolitan area.

Typically a metropolitan area is identified in name by the largest central city in the area. However, many areas have multiple city names and some areas bear its county name.

There are four types of metropolitan areas. All are referred to by government as "metropolitan areas" but there are some differences.

**MSA:** Metropolitan Statistical Area. This is the most frequent metropolitan area. It is not less than one county and a preponderance of the economic activity is contained within the geographic definition.

**NECMA:** New England County Metropolitan Area. The same as an MSA but it is composed of counties in New England, hence the name.

**PMSA:** Primary Metropolitan Statistical Area. This area meets the definition of an MSA but it has been determined there is significant economic linkage with an adjoining metropolitan area. The economy is not as "contained" as an MSA. However, the linkage is not sufficient enough to join the two areas into one MSA. Each metropolitan area which has this linkage is called a PMSA.

---

**CMSA:** Consolidated Metropolitan Statistical Area. This area includes adjoining PMSA's. Since there is linkage among PMSA's, data is totaled and published for the consolidated area. Sometimes they are called "major metropolitan areas."

## ***Economic Strength Ranking***

POLICOM Corporation annually measures and ranks the "Economic Strength" of the 318 metropolitan areas for the purpose of studying the characteristics of strong and weak economies. Economic strength is a combination of both the rate of growth and the consistency of the growth. Simplistically, the formula is "Growth – Instability = Strength."

To determine the economic strength for the metropolitan areas, 25 years of data is examined. The average annual growth rate and the average annual deviation are calculated for eighteen different categories in the economy for two different time periods.

For the 2002 rankings, the time periods include the 15-year term from 1976 through 1990 and the 10-year term from 1991 through 2000.

The eighteen categories include the following:

Per Capita Personal Income  
Earnings – All Workers  
Employment – All Workers  
Average Earnings Per Worker  
Wage & Salaried Workers – Earnings  
Wage & Salaried Workers – Employment  
Wage & Salaried Workers – Average Earnings Per  
Nonfarm Proprietors – Earnings  
Nonfarm Proprietors – Number of  
Nonfarm Proprietors – Average earnings per  
Retail Trade – Earnings  
Retail Trade – Employment  
Retail Trade – Average Earnings Per Worker  
Construction – Earnings  
Construction – Employment  
Construction – Average Earnings Per  
Medical Transfers to the Poor  
Income Maintenance

---

These categories are chosen as they reflect how the economy is behaving, not what is causing it to behave in a particular manner. Additionally, related categories were used to create redundancy to compensate for anomalous data.

The average deviation from previous year (DEV) and the average annual increase (AAI) were calculated for each category for each time period. The DEV was subtracted from the AAI to create a deviation factor for each category. Each category was adjusted to give each equal weight. The data for both the 15-year and 10-year terms were totaled for each of the categories. The total for the 10-year term was doubled (giving the last ten years twice the emphasis of the previous fifteen years) and added to the total for the 15-year term.

From the totals, the 318 metropolitan areas were given an “Economic Strength Ranking.” The Austin-San Marcos, TX MSA is ranked the strongest economy in the nation and the Odessa-Midland, TX MSA the weakest.

Following are the strongest and weakest 25 economies. The entire list of all metropolitan areas, in alphabetical order, the respective 2001 economic strength ranking appears next.

## ***Economic Strength Ranking – Previous Years***

POLICOM Corporation has created rankings for the metropolitan areas for each of the last eight years based upon the previous 25-years of data. These rankings, along with the geographic definitions for the metropolitan areas, state maps, and a host of other information regarding local economies, are posted on its web site:

## **Economic Data**

The following is the economic data used to create this Analysis. It is processed and published by the Bureau of Economic Analysis (BEA), U. S. Department of Commerce.

The Bureau of Economic Analysis is the official economic data collector and publisher for the Federal Government. Estimates made by the BEA are considered the “official” records for the country.

The data is considered “source data,” as it has been principally created from a review of administrative records as opposed to surveys and polls.

The data provided includes the earnings for the major industrial classifications to the “2-digit” SIC level. Employment is provided to the 1-digit SIC level. To protect the privacy of individual employers on a local level, employment is not provided to the 2-digit level, as this would result in extremely frequent data suppression.

Please note the following codes:

- (D) Data suppressed to protect the privacy of an individual employer
- (N) No data collected or reported
- (L) To little data for entry. In Earnings, this means less than individuals earned \$50,000 for the year. For Employment, this means fewer than 10 people were employed for the year.

**Pinellas County, FL**
